Description de la conférence

Movement System Impairment Assessment: Integrating Technology to Facilitate Objective Measurement, Movement Correction, and Patient Education

Conférenciers

Judy Gelber, PT, DPT, OCS et Gregory Holtzman, PT, DPT

Historically, assessment of movement and movement impairments in a clinical setting has largely been based on visual observation.

While visual observation works, many movement impairments may be difficult to visualize accurately, hard to quantify, and/or challenging for the patient to understand or correct.

The purpose of this lecture is to increase participant knowledge and awareness of available technology to assess movement, in order to facilitate movement correction and patient education. Technology to be discussed will include mobile applications for phone/tablet, wearable devices, and video capture platforms.
